Each edition has fewer loads than the previous one. There are just a couple new loads, but common stuff like the 9mm has fewer each revision. 9mm has had a huge burst in popularity of 135gr loads for action shooting games not a mention. I still like the reference, but if they come out with a 51st, I won't be buying it unless it has new data for old loads. There are new bullets and powders out all the time, and adding 2 powders and 2 calibers does not constitute a new edition, especially when other information has been removed. Get it back together Lyman. Does this make a difference, Yes, a lot the loading manuals follow this same format, but there is so much changing in reloading, manuals are having a hard time keeping up with the new information. This is a fine reloading manual, but I would recommend that you have several manuals that are not necessarily specific to a bullet or powder manufacture, because most of them are limited to only the information that applies to the products that they make, which is fine if they are your favorites to use in reloading. This is not true for all of them, but I would suggest that you really look at the information that each one offers to see if it will be the most helpful to your type of reloading. The companies that have reloading products spend a lot of money in developing this information at a very reasonable price for us, we just need to pick the ones that work best for each of us. It goes over all the basics of reloading and also has some advanced chapters. I also bought the Hornady 10th edition, but it's more of an advertisement to for buying their stuff and doesn't go over the basics. The Lyman keeps it simple and has some great information.

Why Lyman included loads for cast lead bullets where many other manuals do not. Orange highlights the max loads in every caliber so theres little chance of misreading or misinterpreting load data. A favorite rifle caliber of mine to reload for,.308 Winchester, shows 12 jacketed bullets and 7 cast lead bullet loads. In.45 Auto using a 200 gr cast SWC, the manual lists 20 separate powder loads. Page 12 through page 85 walks the new reloader through the entire process, step by, step using large color photos and very specific information. I always read through these chapters as theres usually a pointer or two that I pick up on that I havent been aware of previously. New calibers listed included the.300 Blackout, 6.5 x 284 Norma, and the 6.5 Grendel, among others. All in all the 50th Lyman Reloading Handbook is an essential tool for anyones reloading bench. Packed full of great, essential information, its a great value as always.They both are great references for a beginning loader. In this Lyman version, the history of each cartridge is recorded in detail. I find it fascinating to read the how and why each one was developed. There is also plenty of detailed information to help make an wise decision to choose the proper loading for my needs. This is something nice to read instead of watching whatever the family has on TV.I appreciated the in depth look into the interaction of component parts and how those piece parts interact to make the completed bullet function properly. The barrel section was interesting as well The manual contains 400 or so pages of Reloading data, featuring what I think are helpful bullet synopsis. I dont know how many calibers exist, but this book must cover most of them. Probably the least useful section was History, however there was still useful information found there. Ive spent hours absorbing the information contained between the front and back covers. It answered many questions I had always wondered about.

I've found some books have alternate loads. This one's a few years old. For the popular cartridges it is pretty thorough, but I've noticed Lyman's has some that this one doesn't have. This one would be good as a 2nd source of load data. This is a good addition. Picking up older reloading guides offer you a wealth of knowledge at pennies on the dollar! Great reading material.
